Can fiber optic cables be placed together with electrical cables

Overview

General Consideration: It is generally not recommended to run fiber optic cables in the same conduit as electrical power cables.

Key Takeaways

Fiber optic cables can sometimes be placed near electrical cables, but best practice is to separate them to avoid safety risks, heat issues, and regulatory non-compliance.

Key Considerations

Electromagnetic Interference (EMI): Fiber optic cables transmit data using light, making them inherently immune to EMI from electrical cables. However, the components at either end of the fiber, such as transceivers, may be affected if proper separation is not maintained, especially in mixed installations with copper or other metallic cables. Heat and Physical Damage: Electrical cables can generate heat, which may degrade fiber optic cable performance over time.

Running both types of cables in the same conduit increases the risk of crushing, bending, or other physical damage to the fiber. Regulatory Compliance: According to the National Electrical Code (NEC) Article 770, non-conductive fiber optic cables can share a cable tray or raceway with electrical conductors under certain voltage limits (up to 1000 volts). Conductive or armored fiber cables, however, are not allowed in the same tray as electrical cables due to safety concerns.

Best Practices

Separate Conduits or Trays: The safest approach is to use separate conduits or cable trays for fiber optic and electrical cables to minimize risks of heat, physical damage, and regulatory violations. Conduit Dividers: If space constraints require sharing a conduit, physical dividers can provide a barrier between fiber and electrical cables, reducing potential interference and mechanical stress. Hybrid Cables: Some manufacturers offer hybrid cables that combine fiber and electrical conductors in a single assembly, designed to handle heat and minimize interference safely.

Installation Guidelines: Maintain proper grounding for nearby copper cables, avoid long parallel runs with electrical cables, and ensure fiber cables are not bent beyond their minimum bend radius.

Summary

While fiber optic cables are immune to EMI and can technically be installed near electrical cables, the recommended practice is to separate them whenever possible. Non-conductive fiber may share trays with electrical cables under NEC guidelines, but conductive fiber should not. Using separate conduits, dividers, or hybrid cables ensures safety, longevity, and compliance with standards.
