

Core Switch and Access Configuration Trunk

Overview

In this lesson, we configure a trunk between two Cisco Catalyst switches using 802.1Q. I have configured links from Distribution to Core with Trunk Links having a common NATIVE VLAN which VLAN 200. Would it be a much more precise/ accurate design to just implement ACCESS Links to ports in between DS and CS and having a common VLAN 200?

Local VLANs are also implemented, none of the. For the purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. Exceptions may be present in the documentation due to. As shown in Figure 3-11, access switches SwitchB and SwitchC of the data center connect to core switch SwitchA. SwitchB and SwitchC connect to many users, and SwitchA connects to the external network through the egress router. A single switch port can carry single VLAN traffic. Note: All switch ports are assigned VLAN 1 by default (VLAN 1 cannot be modified or. Virtual LANs, or VLANs, are a logical way to limit network traffic and prevent it from being propagated everywhere on the network where it doesn't need to be. There are three types of Ethernet traffic: Unicast: traffic directed to another Ethernet device specifically. Without trunks, you'd need a separate physical link for each VLAN, which is impractical in most networks.
