Do cables need to be secured in cable trays

Overview

Wiring in Cable Trays: Your Guide to Tidy and Safe Learn essential principles for wiring in cable trays. Our guide covers segregation, fill, bending, groun.

Key Takeaways

Yes, cables generally need to be secured in cable trays, with specific intervals and exceptions defined by cable type and NEC requirements.

General Requirement

Cables installed in cable trays should be secured to prevent movement, sagging, or damage, ensuring mechanical stability and maintaining proper spacing for heat dissipation and electrical safety. Securing cables also facilitates easier maintenance, inspection, and future upgrades.

Code and Cable Type Considerations

Type T

C (Tray Cable): Must be secured at intervals not exceeding six feet.

T

C cables are generally restricted to use within cable trays or raceways, except for short transitions (up to six feet) between trays and equipment when not subject to physical damage. Type TC-ER (Exposed Run): Can leave the tray for distances up to six feet without continuous support, provided they are supported and secured. Instrumentation Tray Cable (ITC): Typically used for low-voltage control or instrumentation circuits and must also be supported according to manufacturer and NEC guidelines.

Practical Installation Tips

Use cable ties, clamps, or lacing at recommended intervals to maintain organization and prevent cables from sagging or crossing improperly. Ensure bend radius requirements are maintained at tray exits and transitions to avoid conductor damage. In high-traffic or outdoor areas, consider tray covers to protect cables from physical damage or environmental exposure, though securing cables remains essential.

Exceptions

Some cables, such as Type TC-ER, may have limited runs outside the tray without continuous securing, but this is strictly regulated and must comply with NEC Article 392. Cables with durable outer jackets may not require additional securing if they are fully supported by the tray and not subject to mechanical stress.

Summary

Securing cables in cable trays is a standard practice and often a code requirement to ensure safety, prevent mechanical damage, and maintain proper electrical performance. The exact method and interval depend on the cable type, installation environment, and NEC guidelines, with most tray-rated cables requiring securing at intervals of six feet or less.
