# Dual-core lc interface transmission

## Overview

Fiber communication relies on light transmission in one direction per core. A duplex LC connector pairs two fibers: One fiber handles Tx (transmit). Correct polarity (A-to-B) is essential. This article explains what Duplex LC connectors are, how they work, the difference between single-mode and multimode use, how to choose and maintain them, and why they remain central to fiber network design. The connector integrates two LC (Lucent Connector) interfaces in a single compact housing, allowing one fiber to transmit optical. Efficient bi-directional transmission: Dual-core design supports independent bi-directional communication (single-core transmitter, single-core receiver), eliminating the need for additional patch cords, simplifying cabling structure, and enhancing transmission efficiency. Flexible Interface. LC Adapters and Cable Assemblies meet the growing demand for small form factor, high-density fiber optic connectivity with simplex, duplex, single-mode and multimode options. 50mm ferrule connectors, without sacrificing performance. It covers LC connectors, LC patch cables, uniboot designs, armored. Many LC connectors on the market are too bulky for dual-interface transceivers.
