Environment in which optical modules are used

Overview

They are used in fiber optic communication systems to transmit data over long distances with minimal loss and interference. During this process, a variety of. Optical modules are compact devices that convert electrical signals into optical signals and vice versa. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. BiDi transceiver, a compact optical transceiver with WDM (wavelength division multiplexing) technology and SFP multi-source protocol (MSA) compliance, allows fast data transmission using a single fiber optic for both sending and receiving signals, saving resources and cutting infrastructure costs.
