Expanding Huawei Fiber Optic Switch Ports

Overview

Network Switches | Huawei EnterpriseHuawei campus switches are ideal for building future-proof campus networks with simplified management, high reliability.

Key Takeaways

Huawei fiber switch ports can be expanded using SFP/SFP+ optical modules, combo ports, and stacking solutions, depending on the switch model and network requirements.

Understanding Port Types and Modules

Huawei switches, such as the S5700, S5720, and S6700 series, offer multiple fiber port types: 100/1000BASE-X ports: Standard fiber ports supporting 1 Gbps or 100 Mbps connections. 10GE SFP+ ports: High-speed 10 Gbps fiber ports for uplinks or server connections. Combo ports: Each combo port has one optical and one electrical port, but only one can operate at a time.

The active port is determined automatically or by which connection is made first. SFP/SFP+ modules: Pluggable transceivers that allow you to connect single-mode or multimode fibers. Single-mode fibers are used for long-distance connections, while multimode fibers are suitable for short distances.

Methods to Expand Fiber Connectivity

Install Additional SFP/SFP+ Modules Each empty SFP/SFP+ slot can be populated with a compatible optical module. Ensure the module matches the fiber type (single-mode or multimode) and the desired transmission distance. Use Combo Ports Efficiently If your switch has combo ports, you can switch between copper and fiber connections.

Only one port in a combo pair can be active, so plan connections to maximize fiber usage. Stacking Switches Some Huawei switches, like the S6700 series, support stacking. By stacking multiple switches, you can effectively increase the number of fiber ports available while maintaining a single management interface.

Upgrade to Higher-

Density Models For large-scale expansion, consider switches with higher port density. For example, the S6700 series provides up to 48 line-speed 10GE ports, suitable for data centers or high-traffic environments.

Pre-

Connected Fiber Infrastructure Using Huawei's ODN 3. 0 solution, pre-connection of fiber cables to optical splitters and FATs can simplify port expansion and reduce onsite splicing, ensuring reliable connections.

Best Practices

Match fiber type to module: Use single-mode modules with single-mode fibers and multimode modules with multimode fibers. Check switch capacity: Ensure the switch supports the number of SFP/SFP+ modules you plan to install. Consider power and cooling: Adding modules increases power consumption and heat; verify that the switch's power supply and fans can handle the load.

Plan for future upgrades: Use modular switches or stacking to allow seamless expansion without replacing the entire switch. By combining SFP/SFP+ modules, combo port management, stacking, and high-density switches, you can effectively expand Huawei fiber optic switch ports to meet growing network demands while maintaining performance and reliability.
