Key Takeaways

ST, SC, LC, and FC connectors are commonly used in fiber optic testing, with proper cleaning, alignment, and reference cables being critical for accurate measurements.

Common Connector Types

Fiber optic testing typically uses connectors with cylindrical ferrules that align the fiber cores. The most widely used connectors include: ST (Straight Tip): Bayonet-style connector, easy to connect and disconnect.

S

C (Subscriber Connector): Snap-in connector, widely used in data networks.

L

C (Lucent Connector): Small form factor, ideal for high-density applications.

F

C (Ferrule Connector): Screw-on type, often used in high-vibration environments. These connectors are designed to mate with adapters that ensure precise alignment, which is essential for low-loss testing.

Role in Testing

Connectors are integral to fiber optic testing because they interface the cable under test with launch and receive reference cables. The quality and cleanliness of these connectors directly affect measurement accuracy. Testing typically involves: Single-ended testing: Measures the loss of one connector at a time using a reference cable.

Two-cable method: Includes the connector loss of both ends of the reference cables, which can introduce measurement uncertainty. Three-cable method: Uses a known good cable between launch and receive cables to reduce connector-related errors. Reference cables should be tested beforehand to ensure they are in good condition, using methods like FOTP-171 to verify connector performance.

Best Practices

Clean connectors before testing to avoid contamination, which can significantly increase insertion loss. Use high-quality adapters to maintain low-loss connections. Select appropriate launch and receive cable lengths: For OTDR testing, singlemode long-distance tests may require launch cables of at least 1 km, while multimode or short-distance tests can use 50–100 meters.

Follow standards: IEC, TIA, and FOA provide guidelines for connector geometry, insertion loss testing, and proper reference methods.

Tools for Connector Testing

Specialized tools help verify connector integrity and fiber continuity: Visual Fault Locators (VFLs): Detect breaks, bends, and bad connectors.

Fiber Quick

Map: Locates high-loss splices and contaminated connections. FiberLert™ : Detects active fibers and polarity without complex setup. Proper selection and handling of connectors, combined with adherence to testing standards, ensure reliable fiber optic measurements and network performance.
