Flame-retardant wiring for fire protection distribution boxes

Overview

The present invention relates to an explosion-proof and flame-retardant distribution box, comprising an electric box main body.

Key Takeaways

Flame-retardant wiring and fire-rated enclosures are essential for maintaining electrical functionality and safety during a fire.

Fire-

Resistant Wiring

For distribution boxes in fire-sensitive areas, fire-resistant cables are recommended. Standard options include: Mineral Insulated (MI) Copper Cables: Highly fire-resistant, compliant with BS EN 60702-1, capable of maintaining circuit integrity under extreme heat.

Low-

Smoke Zero Halogen (LSZH) Cables: Reduce toxic gas emissions and smoke density during fire, meeting BS 7629-1 standards.

Enhanced Fire-

© 2026 CGWEB NETWORK INFRASTRUCTURE - All rights reserved

Resisting Cables: Designed for up to 120 minutes of fire survival (BS EN 50200 PH120 + BS 8434-2), suitable for hospitals, high-rise buildings, and phased evacuation scenarios. Fire-resistant wiring ensures that emergency circuits, fire alarms, and escape route lighting remain operational during a fire, supporting safe evacuation and firefighting efforts.

Fire Protection Enclosures

Distribution boxes should be housed in fire-rated enclosures to prevent fire spread and protect internal wiring: ABB Fire Protection Enclosures: Available in F30/F90, I30/I90, and E30/E90 ratings, providing 30–90 minutes of fire resistance and maintaining functionality during fire events.

OBO Fire

Box: Features ceramic connection terminals and halogen-free thermoplastic housing, ensuring secure mechanical and electrical connections under fire conditions, with IP66 protection. These enclosures are tested according to DIN 4102 standards and are designed to maintain circuit integrity while minimizing smoke and toxic gas release. Regulatory GuidanceBS 7671: 2018, Chapter 42: Specifies precautions for electrical installations in locations with increased fire risk, including selection of equipment to prevent temperature rise that could ignite nearby materials.

B

S 5839-1: 2025 and BS 7671 Regulations: Require fire-resistant wiring for escape routes, fire alarms, and emergency lighting, with proper segregation of circuits to reduce interference and maintain safety.

Installation Considerations

Use non-combustible supports such as metal fixings for fire alarm and escape-route cabling; plastic clips alone are insufficient.

Segregate LV and EL

V circuits and ensure fire alarm circuits are independent to prevent short-circuits. Ensure ventilation and cable entry points in enclosures are fire-protected, automatically closing during fire events.

Summary

For fire protection distribution boxes, combine flame-retardant or fire-resistant cables with certified fire-rated enclosures. Compliance with BS 7671, BS 5839-1, and DIN 4102 ensures that critical circuits remain operational during a fire, reduces smoke and toxic gas hazards, and supports safe evacuation. Proper installation, segregation, and support of wiring are essential to maximize fire safety and maintain electrical functionality.
