G652 Fiber Optic Specifications

Overview

G.652 fiber is designed to have a zero-dispersion wavelength near 1310 nm, therefore it is optimized for operation in the 1310nm band and can also operate at 1550 nm.

Key Takeaways

G. 652 is a standard single-mode optical fiber optimized for 1310 nm and 1550 nm transmission, with low attenuation, controlled chromatic dispersion, and compatibility with analog and digital systems.

Core Fiber Attributes

Mode Field Diameter (MFD): Typically 8. 6–9. 5 µm at 1310 nm, ensuring single-mode operation and low splice loss.

Cladding Diameter: Standard 125 µm with tight tolerance for compatibility with connectors and splicing equipment. Core Concentricity Error: ≤0. 5 µm to minimize splice and connector losses.

Cladding Non-

Circularity: ≤1% to maintain uniform optical properties. Cut-off Wavelength: ≤1260 nm for G. 652.

D, ensuring single-mode operation across 1310–1550 nm. Macrobending Loss: ≤0. 75 dB at 1550 nm for a 30 mm radius bend over 100 turns, suitable for tight installation environments.

Chromatic Dispersion: 17–25 ps/(nm·km) at 1550 nm; near zero at 1310 nm, with longitudinal uniformity maintained along the fiber length. Material Properties: Pure silica core with doped cladding to control refractive index profile and minimize non-linear effects. Refractive Index Profile: Standard step-index profile for single-mode operation.

Differential Group Delay (DGD): Low polarization mode dispersion, typically ≤0. 1 ps/√km. Non-linear Coefficient: Approximately 1.

3 W^{-1}·km^{-1}, suitable for long-haul and metro networks.

Transmission and Attenuation

Attenuation Coefficient:≤0. 35 dB/km at 1310 nm≤0. 22 dB/km at 1550 nm≤0.

50 dB/km at 1625 nm (optional testing wavelength)Local Attenuation Discontinuity: ≤0. 1 dB for cabled fiber, ensuring minimal signal loss over splices and connectors.

Cable and Link Attributes

Polarization Mode Dispersion (PMD): ≤0. 1 ps/√km for cabled fiber. Link Design Considerations: Statistical and worst-case methodologies are used to estimate system performance, including concatenated cable links, attenuation, chromatic dispersion, and DGD.

Wavelength Range: Optimized for 1310 nm and 1550 nm, with extended operation from 1270–1625 nm for G. 652. D fibers.

Applications

Telecommunication Networks: Long-haul, metro, and access networks.

FT

Tx Deployments: Suitable for Fiber-to-the-Home (FTTH) due to low macrobending loss. Premises Wiring: Patchcords, interconnection cables, and LAN applications.

CATV and Analog/

Digital Transmission: Compatible with both analog and digital signals across standard wavelengths. SummaryG. 652 fibers, particularly the G.

652. D variant, provide low-loss, low-dispersion single-mode performance suitable for modern optical networks. Their standardized geometrical and optical parameters ensure interoperability, minimal splice loss, and reliable long-term performance, making them a widely adopted choice for telecom and data networks.
