How many tubes should I connect to the fiber optic pigtail for optimal use

Overview

How to Splice Fiber Optic Pigtails: A Step-by-Step GuideMaster the art of fiber termination. Learn how to splice fiber optic pigtails using fusion splicing.

Key Takeaways

The number of fibers (tubes) you connect to a fiber optic pigtail depends on the fiber count of your incoming cable and the type of pigtail you are using, ranging from single-fiber to multi-fiber configurations.

Determining Fiber Count

Fiber optic pigtails are available in single-fiber and multi-fiber configurations, with common counts including 1, 2, 4, 6, 8, 12, 24, 48, and even 72 fibers. The choice depends on your network requirements: Single-fiber pigtails are standard for most enterprise and low-density applications. Multi-fiber pigtails are used in high-density environments like data centers or ODF panels, where multiple fibers need to be terminated in a single tray.

Matching Pigtails to Incoming Cables

Each fiber in the pigtail should be spliced to a corresponding fiber in the incoming cable. For example: If your incoming cable has 12 fibers, you should use a 12-fiber pigtail to match each fiber individually. For a 24-fiber trunk, a 24-fiber pigtail or two 12-fiber pigtails can be used, depending on your splice tray capacity and layout.

Connector and Polarity Considerations

Pigtails come with factory-installed connectors (LC, SC, ST, FC, etc.) on one end, while the other end is bare for splicing. Multi-fiber pigtails often use color-coded fibers to maintain proper polarity and simplify identification during splicing. Ensure the connector type and fiber mode (single-mode or multi-mode) match your network equipment and incoming cable.

Practical Tips

Always order a few extra feet of pigtail to allow for splicing errors or adjustments. Use a fusion splicer for permanent, low-loss connections, or a mechanical splice for temporary or quick installations. Label each fiber after splicing to avoid confusion in high-density setups.

In summary, the number of tubes you connect to a fiber optic pigtail should match the fiber count of your incoming cable, ensuring each fiber is spliced individually and correctly identified.
