How to cut fiber optic pigtails

Overview

Confused about fiber optic pigtails—which connector type, which polish, fusion or mechanical splice?

Key Takeaways

Cutting a fiber optic pigtail requires precision using a fiber cleaver to ensure a clean, perpendicular end for low-loss splicing.

Tools and Preparation

Before cutting, gather the necessary tools: a fiber cleaver, fiber stripper, isopropyl alcohol wipes, and protective eyewear. Ensure the work area is clean and free of dust, as fiber optics are highly sensitive to contamination. Handle the fiber carefully to avoid breakage or injury.

Step-by-

Step Cutting Process

Strip the Fiber Jacket: Use a fiber stripper to remove the outer jacket and buffer coating from the bare end of the pigtail, exposing the glass fiber. Be careful not to nick or scratch the fiber. Clean the Fiber: Wipe the exposed fiber with an isopropyl alcohol wipe to remove any debris or oils that could affect splicing quality.

Position in the Cleaver: Place the cleaned fiber into a precision fiber cleaver, aligning it according to the manufacturer's markings. The cleaver ensures a perpendicular cut, which is critical for low-loss fusion splicing. Perform the Cut: Activate the cleaver to score and break the fiber cleanly.

The result should be a smooth, flat end-face with minimal angle deviation. Inspect the Cut: Use a fiber microscope or inspection scope to verify the cut quality. A clean, perpendicular cut reduces insertion loss and ensures a reliable splice.

Additional Tips

Avoid Field-

Termination: Factory-terminated connectors on pigtails provide higher precision than field-polished connectors, so cutting and splicing the bare end is preferred over building a connector in the field. Patch Cord Conversion: If pigtails are unavailable, a certified patch cord can be cut in half to create two pigtails, but always verify splice performance afterward. Safety: Always wear protective eyewear and dispose of fiber scraps properly, as glass shards can cause injury.

By following these steps, you can cut a fiber optic pigtail cleanly and prepare it for fusion or mechanical splicing, ensuring optimal network performance and minimal signal loss.
