# Inter Optical Module Parameters

## Overview

This article will systematically analyze the core performance indicators of optical modules from five dimensions: transmit optical power, receive optical power, overload optical power, receiver sensitivity, and extinction ratio. Transmit Optical Power: Measuring "Light. Optical modules are crucial for today's communication systems as they convert electrical signals into light signals for rapid data transfer. Let's take a look below! Optical module parameters Center wavelength: the unit of center wavelength is nanometer (nm), currently. The Transmitter Optical Sub Assembly (TOSA) is responsible for the emission of light. This assembly comprises a light source, such as a laser diode or a semiconductor light-emitting diode (LED), an optical interface, a. Transmission Rate: The transmission rate of the optical module refers to the number of bits transmitted per second, expressed in Mb/s or Gb/s. ▶ 1Gbps optical modules: Common representations.
