Length of Screw in Cable Tray

Overview

This document provides details on installing cable trays and their support systems. It includes diagrams showing how to mount cable trays on walls using pre-fabricated flanges or channels.

Key Takeaways

The screw length for a cable tray should be sufficient to securely anchor the tray to the support structure, typically extending at least 1 to 1. 5 inches into the mounting surface beyond the tray bracket.

Determining Screw Length

The correct screw length depends on several factors: Tray Type and Material: Ladder, ventilated, or solid-bottom trays may require different screw lengths to ensure stability. Ladder trays, often used for heavy-duty cables, need screws that can handle the weight and vibration of the cables. Support Method: Trapeze hangers, cantilever brackets, or wall-mounted supports require screws long enough to penetrate the structural member (beam, wall, or ceiling) while leaving enough thread engagement to hold the tray securely.

Load Considerations: The screw must support the weight of the cables plus the tray itself. For heavy cable loads, longer screws or bolts with washers and lock nuts are recommended to prevent loosening.

Practical Recommendations

Minimum Penetration: Screws should penetrate at least 1 inch into wood or metal studs, or follow the manufacturer's specifications for concrete anchors. Diameter and Type: Use screws or bolts appropriate for the material (e.g., self-tapping screws for metal, lag screws for wood, or expansion anchors for concrete). The diameter should match the tray bracket holes and provide sufficient shear strength.

Spacing Between Supports: NEC guidelines suggest horizontal tray supports every 4 to 6 feet, with a maximum of 5 feet for heavy loads. Proper spacing reduces stress on each screw, allowing standard-length screws to suffice.

Installation Tips

Ensure the screw fully engages the support structure without bottoming out. Use washers to distribute load and prevent bracket deformation. For perforated trays, ensure screws do not interfere with cable placement or create sharp edges that could damage insulation.

Always follow the tray manufacturer's recommendations, as some proprietary systems may require specific screw lengths or types. Key Takeaway: While there is no universal screw length, a good rule of thumb is to select screws that extend at least 1 to 1. 5 inches into the support structure beyond the tray bracket, with appropriate diameter and type for the material, ensuring secure and code-compliant installation.
