Measurement values of the optical power meter

Overview

Power-Measuring Instruments Instruments that measure in dB can be either optical power meters or optical loss test sets (OLTS).

Key Takeaways

An optical power meter measures the absolute optical power of a light signal, relative power loss, and can report values in units such as dBm, watts, or decibels.

Absolute Optical Power

Optical power meters (OPMs) measure the absolute power of light emitted from a source, such as a laser, LED, or optical transmitter. This is typically expressed in dBm (decibels relative to 1 milliwatt) or in watts ranging from picowatts to milliwatts, depending on the system and detector sensitivity. For example, telecom transmitters may output 0 to +10 dBm, while receivers can detect signals as low as -30 dBm.

Relative Power and LossOPMs can also measure relative optical loss, which is the difference in power before and after a component, connector, or fiber segment. This is expressed in decibels (dB) and is crucial for evaluating fiber attenuation, connector losses, and splice losses. Typical fiber losses include 0.

Wavelength-

Dependent Measurements

Optical power meters are calibrated for specific wavelengths, usually in the range of 800–1700 nm, to ensure accurate readings. The measured power can vary with wavelength, so the meter must be set to the correct test wavelength to avoid errors.

Detector Signal Types

Modern OP

Ms can handle various detector outputs, including DC current or voltage, AC peak-to-peak signals, pulse voltages, or integrated signals. Detectors may include photodiodes, thermopiles, or pyroelectric sensors, allowing the meter to measure continuous-wave or pulsed optical signals.

Applications

Optical power meters are used in fiber optic network installation, maintenance, lab testing, and research, enabling technicians to verify transmitter output, receiver input, and component performance. They are essential for ensuring system efficiency and troubleshooting optical networks. In summary, an optical power meter can measure absolute optical power, relative power loss, and wavelength-specific power levels, providing readings in dBm, watts, or dB, and can accommodate various signal types and detector technologies.
