Optical Differential Relay Protection Service

Overview

The invention can evaluate the state of the relay protection of the power system and can timely and accurately put forward the corresponding relay protection inspection and maintenance...

Key Takeaways

Optical differential relay protection uses high-speed fiber optic communication to detect line faults by comparing currents at both ends of a transmission line, providing fast, selective, and reliable protection.

Principle of Operation

Optical differential protection is based on the differential principle, which compares the current entering and leaving a protected line section. According to Kirchhoff's law, the sum of currents at a node should be zero in an ideal system. Any difference between the measured currents indicates a fault within the protection zone.

Fiber optic communication enables high-bandwidth, low-latency data exchange between relays at both ends of the line, ensuring rapid fault detection and tripping of circuit breakers independent of line loading, CT saturation, or tapped loads. Key FeaturesHigh-speed and selective protection: Optical relays can operate in subcycle times, isolating only the faulted section without affecting the rest of the network. Phase-segregated measurement: Relays measure local and remote phase currents, differential current, and sequence components to improve accuracy.

Stability under non-ideal conditions: Advanced stabilization techniques handle CT saturation, line asymmetry, phase rotation, and tapped lines. Integration with automation systems: Modern relays include communication interfaces, recorders, and logging functions for fault analysis, transformer monitoring, and system automation.

Communication Methods

Optical differential relays typically use direct fiber optic links or metallic pilot wires. Fiber optics are preferred for long-distance lines due to secure, fast, and interference-free transmission. The communication ensures that the differential algorithm receives synchronized current measurements from both line ends.

Applications

Overhead lines and underground cables: Provides protection for high-voltage transmission lines and distribution feeders. Lines with transformers or tapped loads: Relays can be configured to account for complex network topologies. Backup protection: Distance and overcurrent elements are often integrated to provide secondary protection in case of communication failure.

Advantages

Fast fault clearance reduces equipment damage and improves system stability. High selectivity ensures only the faulted section is isolated. Reduced dependency on line loading and CT characteristics.

Enhanced monitoring and diagnostics through integrated recorders and communication with substation automation systems. Examples of Optical Differential RelaysSEL-311L: Offers subcycle line current differential protection with four-zone distance backup and hot-standby channels for reliability. Toshiba GRW200: Provides phase-segregated differential protection using fiber optic or pilot wire communication.

Hitachi Relion RED670/RED650: Multi-function IEDs with line differential protection, distance backup, and configurable automation integration.

AB

B RED615: Compact relay for distribution networks with fiber optic or pilot wire communication, supporting advanced protection and control functions. Optical differential relay protection is increasingly the standard for modern transmission and distribution systems due to its speed, selectivity, and integration capabilities, making it a critical component of reliable and automated power networks.

Article Content

Analysis of optical fiber differential protection based on relay ...

In this paper, the main technology of optical differential protection, in the process of 6 KV power distribution system reform is how to apply this situation are introduced in detail, at the same time, a

Analysis of optical fiber differential protection based on relay protection

The invention can evaluate the state of the relay protection of the power system and can timely and accurately put forward the corresponding relay protection inspection and maintenance...

Line Differential u2028Protection

Fiber optic line differential protection for overhead lines and cables. Fast, selective protection with integrated recorders and communication.

Line Differential Protection for Direct Fibre & Pilot-wire

GRW200 is designed to provide phase-segregated line differential protection for use with metallic pilot wire or direct fibre optic communication channels.

Line Differential Protection for Direct Fibre Pilot Wire Application ...

GRL150 provides fully numerical phase-segregated line differential protection for use with short overhead lines or cable circuits. Communication with the remote terminal is either by pilot wire or

REL50514

"This line differential relay offers withdrawable design with backup memory function enabling industry-leading 10 minute recovery time." "PowerLogic P5 offers users

Line differential protection and control RED615 IEC

RED615 relays communicate between substations either over a fiber-optic link or a galvanic pilot wire connection. Compact and versatile solution for utility and industrial power distribution systems with

Line differential protection relay

The SIPROTEC 7SD82 line differential protection has been designed particularly for the cost-optimized and compact protection of lines in medium-voltage and high-voltage systems.

Line Current Differential Protection over MPLS

© 2026 CGWEB NETWORK INFRASTRUCTURE - All rights reserved

The following test results validate the performance of line current diferential protection through a set of tests involving SEL 411L relays, SEL ICON multiplexers, and an MPLS network made up of MX

SEL-411L Advanced Line Differential Protection, Automation, and

SEL revolutionized the protection industry by building the first microprocessor-based protective relays. These relays integrated, economized, and simplified the art of transmission line protection while

Line differential protection and control RED615 IEC

RED615 is a phase-segregated, two-end, line differential protection and control IED harmonized for overhead line and cable feeders.

The essentials of power systems: Relay protection and communication ...

Protection functions and communications First, I would like to make a note that there are many essentials when we speak about power systems in general. The main relay protection

DIGITAL COMMUNICATIONS FOR RELAY PROTECTION

Fiber optic current differential replacement is a popular choice. AC pilot wire relays do not have facilities for compensating channel delay so it is important to establish that the characteristics of the interface

RED615 ANSI Line differential protection and control

RED615 is a member of ABB''s Relion® family and part of its 615 protection and control product series. The 615 series protection and control relays are characterized by their compactness and

Protective Relaying Philosophy and Design Guidelines

Relay schemes employing some form of line current differential protection technique (pilot wire, phase comparison, charge comparison, etc.) are not load limiting and, as such, no transient load limits are

Line Differential Protection Overview | PDF | Electric Power ...

The document discusses line differential protection, which provides instantaneous protection for faults within the protected zone of a power line. It operates based on comparing currents measured at both

Microcontroller Based Line Differential Protection for OFC

A line differential protection using fiber optics communication is developed using PIC 16F877A Microcontroller. A digital current differential relay needs to compensate for the delay introduced by
