Photoelectric composite long-distance optical cable

Overview

Photoelectric composite cable and optical cable: Analysis Of The. Photoelectric Composite Cables and conventional optical fiber cables differ significant.

Key Takeaways

A photoelectric composite cable integrates optical fibers for high-speed data transmission and electrical conductors for power delivery, enabling long-distance, simultaneous data and power transmission in a single cable.

Structure and Components

A typical photoelectric composite cable combines optical fibers and electrical conductors within a single sheath. The optical fibers can be single-mode for long-distance, high-bandwidth applications like telecom and 5G, or multi-mode for shorter distances such as LANs and CCTV systems, providing immunity to electromagnetic interference (EMI) and low signal loss over long distances. The electrical conductors, usually copper or aluminum, deliver power ranging from 12V to 48V DC or higher for industrial use.

The cable also includes strength members like aramid yarn or steel wire for tensile strength and an outer jacket that is UV-resistant, waterproof, or armored for harsh environments.

Advantages for Long-

Distance Transmission

Photoelectric composite cables are ideal for long-distance applications because they reduce the need for separate power and data lines, simplify installation, and minimize failure points. The optical fibers maintain high-speed data transmission even in high-voltage or EMI-prone environments, while the copper conductors provide reliable power delivery to remote devices such as IoT sensors, mobile base stations, or surveillance cameras. Armored versions are rodent-resistant, waterproof, and durable against bending, making them suitable for outdoor aerial, underground, or industrial installations.

Applications

These cables are widely used in: Telecommunications: Fiber-to-the-antenna (FTTA) and fiber-to-the-room (FTTR) setups for 5G and broadband networks.

Surveillance and Io

T: Powering and connecting cameras, sensors, and access terminals over distances up to 1 km. Industrial and Transportation: High-voltage substations, railways, and traffic control systems where EMI immunity is critical. Harsh Outdoor Environments: Waterproof and armored cables for outdoor 4G/5G surveillance and monitoring projects.

Types and Variants

Photoelectric composite cables come in several forms: Hybrid fiber-coaxial (HFC): Combines fiber optics with coaxial or twisted pair elements for analog and digital signal transmission. Hybrid loose tube or ribbon cables: Offer flexibility and efficient installation while integrating fiber and copper elements. Waterproof armored cables: Designed for extreme outdoor conditions with dual steel wire reinforcement.

Considerations

While composite cables are highly versatile, pure optical cables may still be preferred for ultra-long-distance data transmission without power requirements, such as submarine or intercity backbone networks. Choosing the right cable depends on the balance between simultaneous power and data needs, installation simplicity, and environmental durability. In summary, photoelectric composite long-distance optical cables provide a cost-effective, reliable solution for transmitting both data and power over long distances, particularly in modern communication, surveillance, and industrial applications.

Article Content

Photoelectric composite cable and optical cable: Analysis Of The ...

Photoelectric Composite Cables and conventional optical fiber cables differ significantly in structure, functionality, and applications. Below is a detailed comparison of their key differences and

Photoelectric composite cable

The optoelectronic composite cable contains the components of the optical unit, which can combine the transmitted electric energy with the

What is Photoelectric Composite Cable

By combining fiber optics and coaxial cables, hybrid cables offer enhanced versatility and flexibility. They can seamlessly transmit both analog and digital signals over long distances, making

Waterproof Photoelectric Composite Cable

It integrates power and fiber optic signal lines into one cable, enabling single-cable transmission of both power and data, greatly simplifying outdoor wiring. The dual steel wire reinforced structure provides

WO2021103714A1

The embodiments of the present application relate to the technical field of optical communications, and provide a photoelectric composite cable and an optical communication system. The...

Photoelectric Composite Cable GDFXTBY Cable

The products that can be produced include: FTTH optical cable, air-blown optical cable, ADSS optical cable, mining optical cable, optoelectronic hybrid cable,

Photoelectric Composite Cable (GDTS)

The structure of GDTS photoelectric composite cable involves placing single-mode or multi-mode optical fibers in a loose tube made of high-modulus polyester

Optical-Electrical Composite Longitudinal Watertight Cable: Key ...

Designed for reliability in extreme underwater environments, photoelectric composite longitudinal watertight cables integrate power, data, and robust protection to revolutionize marine...

PHOTOELECTRIC COMPOSITE FIBER CABLE

© 2026 CGWEB NETWORK INFRASTRUCTURE - All rights reserved

Photoelectric composite cable (OPLC) is to place the protected optical fiber unit in the power cable, which can be used in power systems with rated voltage of

CN112117033A

In view of the above, the present invention provides a framework-type long-distance symmetrical optical/electrical composite cable, which is designed to overcome the defects in the...

Optical Fiber Composite Power Cable

Description: Optical fiber composite insulated power cable for low voltages (OPLC) is a new type of photoelectric composite cable for low voltage power lines, and

WO2021103714A1

The photoelectric composite cable and the optical communication system provided by the embodiments of the present application is simple in structure and simplified in manufacturing process while

Photoelectric Composite Fiber Optic Cable: Structure, Specifications ...

Optical Performance The fiber optic component determines the data transmission capabilities of the cable. Most photoelectric composites use either single-mode or multi-mode fibers. Single-mode

FTTR hybrid composite cable

FTTR hybrid composite cable DESCRIPTION FTTR on-site Photoelectric Composite Cable is a hybrid cable of integrated optical fiber and electrical copper wire; applicable for indoor tube conduct wiring,

Photoelectric composite cable

Optical communication cables play a vital role in the entire communication industry and become the cornerstone of modern communication.

Photoelectric Composite Cable GDFXTBY Cable

GDFXTBY photoelectric composite cable is composed of optical unit and electrical unit, and the outer layer is molded into a polyethylene sheath to form a figure 8 structure product. The optical unit is a

Photoelectric Composite Cable | TeleTechno Communications

Applicable for underground installations, conduit and sub-aquatic facilities.

FTTR hybrid composite cable

© 2026 CGWEB NETWORK INFRASTRUCTURE - All rights reserved

FTTR on-site Photoelectric Composite Cable is a hybrid cable of integrated optical fiber and electrical copper wire; applicable for indoor tube conduct wiring, on-site optical fiber connection and electrical
