Power of the primary power distribution box on the construction site

Overview

Power supply on the construction site High-quality construction power distributors guarantee safety and reliability in the power supply to electrical equip.

Key Takeaways

The primary power distribution box at a construction site typically handles three-phase 400 V power from the transformer and distributes it to secondary boards, with capacity determined by the total site load and safety requirements.

Role and Function

The primary distribution box serves as the main hub for electrical power on a construction site. It is directly connected to the transformer's low-voltage side (typically 0. 4 kV) and distributes electricity to secondary distribution boxes, which then supply power to machinery, tools, and temporary site facilities.

It generally does not supply power directly to end-use equipment but ensures that all downstream circuits receive stable and protected power. Voltage and Phase ConfigurationThree-phase power: 400 V for heavy machinery and motorsSingle-phase power: 230 V for smaller tools and lighting, typically supplied via secondary or tertiary distribution boxes The primary box is designed to handle high currents and is equipped with large three-phase circuit breakers, isolating switches, and residual current devices (RCDs) to protect the system.

Capacity and Dimensioning

The power capacity of the primary distribution box depends on the load profile of the construction site: Continuous loads: lighting, site offices, and containersIntermittent or high inrush loads: hydraulic power packs, concrete demolition shears, stone splitters, and other heavy machinery Planning considers rated power, inrush currents, duty cycles, and diversity factors to ensure the box can handle simultaneous operation of multiple devices without overloading. Typical construction site setups use CEE plug systems with ratings such as 16 A, 32 A, 63 A, or 125 A, depending on the expected load. Proper phase balancing is essential to avoid neutral overloading.

Safety and Environmental ConsiderationsIP55 protection class is recommended to protect against dust and water jets Equipped with RCDs and circuit breakers to prevent electrical hazardsClear labeling and lockable panels improve operational safety and allow rapid fault response SummaryThe primary distribution box is the central point for temporary construction power, handling three-phase 400 V from the transformer, distributing it to secondary boards, and ensuring safe, reliable power for all site operations. Its capacity is determined by the total load, including high-inrush machinery, and it incorporates safety devices and environmental protection to maintain compliance and operational efficiency.
