Pre-reserved hole in distribution box 5

Overview

CN115929028A The method for constructing the reserved line hole of the distribution box slot according to any one of claims 1 to 5, wherein an outlet hole.

Key Takeaways

A pre-reserved hole in a distribution box is a pre-formed opening designed to facilitate wiring and conduit installation, ensuring proper alignment and reducing post-construction modifications. Purpose and DesignPre-reserved holes in distribution boxes are created to allow electrical or communication lines to pass through without the need for chiseling or additional drilling after the wall or box is installed. These holes are typically aligned with the distribution box slots and may interconnect with lintel portions or other structural elements to maintain integrity and ease of installation during masonry work (CN115929028A).

Construction Method

During wall construction, the prefabricated distribution box with its reserved holes is placed at a preset position. The surrounding brickwork or masonry is built around the prefabricated member, supporting it while maintaining the alignment of the reserved holes. This method avoids damage to the box and reduces labor-intensive chiseling (CN115929028A).

The reserved hole is usually slightly larger than the box dimensions—about 20mm extra in length and width—to accommodate plastering and ensure a snug fit (ZCEBox).

Installation Considerations

Depth: The reserved depth should equal the thickness of the distribution box plus the plastering layer on the inner wall (ZCEBox). Alignment: The box must be installed horizontally and vertically, with vertical deviation not exceeding 3mm (ZCEBox). Fixing: Concrete or mortar can be used to secure the box within the wall, ensuring no gaps around the edges and coating contact surfaces with anti-corrosion paint (ZCEBox).

Electrical Connections: Power lines, neutral lines, and protective earth lines should be properly connected to busbars or terminals, with clear labeling to prevent errors during installation or maintenance (ZCEBox).

Benefits

Using pre-reserved holes in distribution boxes: Reduces post-construction modifications and chiseling. Maintains structural integrity of prefabricated lintels and walls. Simplifies wiring and conduit installation.

Ensures precise alignment for electrical and communication systems. By following these guidelines, a pre-reserved hole in distribution box 5 can be effectively integrated into the building structure, providing a reliable and efficient pathway for wiring and reducing installation errors (CN115929028A, ZCEBox).
