Railway substation distribution box

Overview

A railway sub-distribution cubicle sits downstream of the main supply. Its job is simple in principle, but critical in practice. It takes an incoming electrical feed and safely distributes it to multiple circuits across signalling, telecoms and lineside infrastructure. Electric-power command facilities that support safe transport and electric-power management systems for electric railways that centrally monitor and control many substations are in. Traction Electrification System A Traction Electrification System (TES) is the combination of the TPS, OCS, and the traction power return system, together with appropriate interfaces to the TES-related supervisory control and data acquisition system (ECCS Energy command and control system). Installed. A traction substation, traction current converter plant, rectifier station or traction power substation (TPSS) is an electrical substation that converts electric power from the form provided by the electrical power industry or railway owned traction power network to an appropriate voltage, current.
