Should cable trays be fitted with covers

Overview

Cable Tray Technical Guide A practical guide to product selection and. The choice of method should be discussed with a local inspector. The best decision.

Key Takeaways

Cable trays do not always have covers; their use depends on environmental conditions, safety requirements, and regulatory standards.

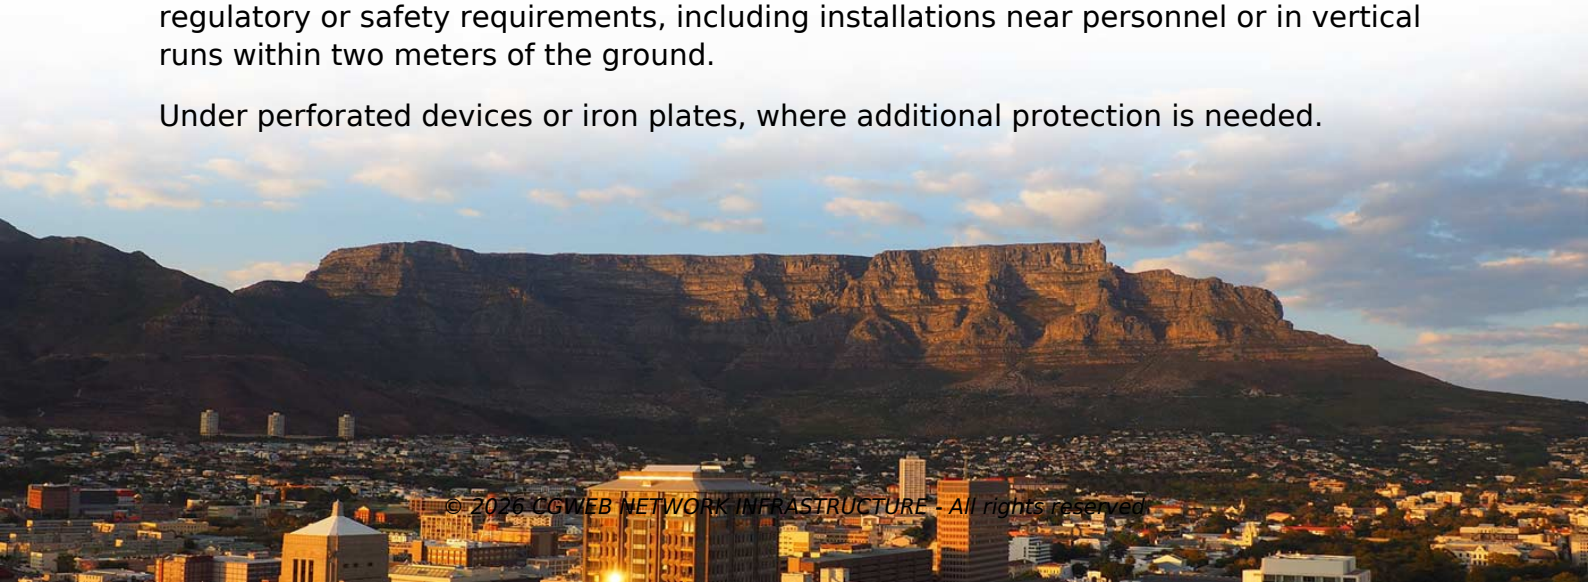

Purpose of Cable Tray Covers

Cable tray covers, also called lids or lidding sections, are designed to protect cables from mechanical damage, dust, moisture, and other environmental hazards while maintaining compliance with safety standards such as NEC 392. 6. Covers can also help with thermal management in data centers and provide electromagnetic shielding in sensitive installations.

When Covers Are Required

Covers are typically necessary in the following situations: Outdoor installations where cables are exposed to weather, wind, snow, or ice. Environments with dust, debris, or potential mechanical damage, such as industrial or construction sites. Special regulatory or safety requirements, including installations near personnel or in vertical runs within two meters of the ground.

Under perforated devices or iron plates, where additional protection is needed.

When Covers May Be Optional

In some cases, cable trays do not require covers: Indoor installations in controlled environments where mechanical or environmental hazards are minimal. Use of tray-rated cables that already incorporate mechanical and UV protection, making solid covers unnecessary. Ventilated covers may be preferred over solid covers in areas with high wind or snow loads to prevent lifting or buckling.

Types of Covers

Cable tray covers come in various designs and materials, including metal, composite, PVC, fiberglass, and copper-clad options. They can be solid, ventilated, dome-shaped, or hat-shaped, depending on the application and environmental requirements. Selection is influenced by factors such as corrosion resistance, load capacity, UV stability, and fire rating.

Key Takeaway

Cable trays do not always have covers; the decision depends on the installation environment, safety considerations, and applicable standards. While covers provide protection and compliance benefits, in controlled or low-risk settings, trays may remain uncovered, especially when using cables designed for exposure. Proper assessment of environmental and mechanical risks is essential before deciding whether to install a cover.
