South African Metal Cable Tray Procurement Specifications

Overview

Explore the reliable and efficient Baobab Metal Systems Cable Trays – designed for seamless cable organization in industrial, commercial, and utility applications across South Africa and beyond.

Key Takeaways

Metal cable trays in South Africa are typically specified according to SANS standards, material type, load capacity, corrosion protection, and intended application.

Standards and Compliance

Metal cable trays in South Africa are generally manufactured to comply with SANS 3575: 2008 / ISO 3575: 2005 for pre-galvanised steel trays, ensuring quality and durability. Many suppliers, such as SAAR Industries, are ISO 9001: 2015 certified, guaranteeing adherence to international quality standards. Compliance with these standards ensures safe, reliable, and efficient cable management systems suitable for industrial, commercial, and infrastructure projects.

Materials and Finishes

Cable trays are available in a variety of materials and finishes to suit different environments: Pre-galvanised steel (Z275): Light-duty applications with mild corrosion protection. Hot-dip galvanised steel: Medium to heavy-duty applications with enhanced corrosion resistance, suitable for outdoor or harsh industrial environments. Stainless steel (304 or 316 grade): Ideal for corrosive environments such as chemical, pharmaceutical, or food processing facilities.

Aluminum alloy: Lightweight and naturally corrosion-resistant, often used in specialized industrial settings. Powder-coated or painted trays: Provide additional protection and color-coded identification for specific installations.

Types of Cable Trays

Different tray designs are used depending on cable type, load, and ventilation requirements: Ladder Cable Tray: Side rails with transverse rungs, suitable for heavy-duty power cables, offering high load capacity and excellent ventilation. Perforated Cable Tray: Ventilated trays with punched holes, balancing cable protection and airflow, ideal for moderate heat-generating cables. Wire Mesh Cable Tray: Open basket construction, commonly used for telecommunications and data cabling, allowing maximum airflow and easy cable entry/exit.

Solid Bottom Cable Tray: Continuous base and sides, providing maximum protection for fragile instrumentation or fiber optic cables, and preventing dust, debris, or EMI.

Channel/

Trunking Tray: Smaller U or C-shaped trays for tight spaces or smaller cables.

Accessories and Installation

Cable trays are typically installed using M6 x 12mm bolts and square nuts for overlap connections, with no splices required for light-duty trays. Accessories include bends, tees, reducers, and supports to ensure proper routing and secure installation. Suppliers provide tailor-made solutions for specific project requirements, ensuring easy installation, durability, and compliance with safety standards.

Applications

These trays are suitable for: Industrial plants and manufacturing facilitiesPower plants and substationsCommercial buildings and infrastructure projectsData centers and telecommunications networksKey Procurement ConsiderationsWhen specifying metal cable trays in South Africa, consider: Load capacity: Match tray type to cable weight and volume. Environmental conditions: Choose material and finish based on corrosion risk. Compliance: Ensure SANS and ISO certifications.

Cable type: Select ladder, perforated, wire mesh, or solid bottom based on ventilation and protection needs. Installation requirements: Include necessary accessories and supports for secure mounting. By following these specifications, procurement ensures durable, safe, and efficient cable management systems suitable for South African industrial and commercial applications.
