Spacing of fireproof partitions for cable trays

Overview

Cable tray installation must comply with specific technical standards to ensure electrical safety, system reliability, and long-term maintainability.

Key Takeaways

Fireproof partitions for cable trays are typically installed at intervals of 3 to 5 meters, or where fire-rated barriers are required, with a minimum horizontal separation of 300 mm between parallel trays when barriers are impractical. General GuidelinesFire-blocking sections or fireproof partitions are installed along cable trays to prevent the spread of fire, protect circuits, and ensure safe operation of electrical systems in industrial and commercial environments. The spacing of these partitions depends on factors such as cable type, fire rating, and installation environment.

Typical spacing: Fireproof partitions are generally placed every 3 to 5 meters along the cable tray run, especially in long horizontal or vertical runs, to limit fire propagation. Parallel trays: When two cable trays run in parallel, a minimum horizontal air gap of 300 mm is recommended if fire-rated barriers are not used, based on UK guidance (BS 8519, BS 5839) for life-safety circuits. Vertical spacing: For floor-to-ceiling or multi-tier installations, maintain at least 150 mm vertical clearance between trays to allow airflow, heat dissipation, and access for maintenance.

Fire-rated materials: Partitions should use fire-resistant boards, mineral wool, or firestop packs, with sealing thickness typically 20–30 mm at penetrations through walls or slabs.

Installation Considerations

Tray type and material: Use fireproof or fire-rated trays where flame containment is required. Ensure mechanical strength to support cable weight and prevent deformation. Circuit segregation: Power and signal cables should be separated either by distance (≥0.

5 m) or by barriers to reduce electromagnetic interference and maintain circuit independence. Maintenance access: Adequate spacing ensures technicians can inspect, maintain, or replace cables safely without compromising fire safety. Regulatory ReferencesBS 8519: 2020 – Recommends separation of primary and secondary life-safety circuits by fire partitions or a minimum 300 mm air gap.

B

S 5839-1: 2020 – Suggests duplicate power supply cables should be segregated with at least 300 mm separation or by fire-resisting barriers. National standards – Fire-blocking sections must use materials stable under environmental conditions, including moisture and rodent exposure. By following these spacing and partitioning guidelines, cable tray installations can achieve effective fire containment, circuit protection, and compliance with safety standards.

Technical Guidelines for Cable Tray Installation and

Cable tray installation must comply with specific technical standards to ensure electrical safety, system reliability, and long-term maintainability. This document

Guide to Fire-blocking Sections (Fire Sections/Fire

Choosing appropriate fire-blocking section materials can effectively improve the fire-proof performance of cable trays and reduce the losses caused

Requirements for fireproof partitions for cable tray installation

Cable trays can be installed across partitions and walls, as well as vertically through platforms and floors, in both wet and dry environments. However, these installations must comply with the Read More

Fire-resistant cable tray partition requirements

Comprehensive guide to cable tray systems requirements: tray types, materials, loading, supports, bonding, routing, and best practices for safe electrical cable management.

Firestopping Requirements for Cable Trays and Wall/Slab Penetrations

© 2026 CGWEB NETWORK INFRASTRUCTURE - All rights reserved

The gap area between firestop packs and cables should not exceed 1 cm2, and the packing thickness should be not less than 24 cm. All gaps inside and around metal trunking must be

Firestop

3M Fire Barrier Moldable Putty+ is a one-part, halogen-free product designed to firestop electrical outlet boxes and a wide variety of through-penetrations including cable, conduit, insulated pipe and metal

Installation location of fireproof partition for cable trays

The installation position of the fireproof bridge partition should be at least 100 millimeters away from the edge of the bridge to ensure that the partition can effectively prevent the spread of fire.

How to set up the fireproof cable tray partition?

The width of the fireproof bridge partition should be greater than or equal to the width of the bridge to ensure that the partition can effectively prevent the spread of fire.

Cable Tray Spacing Standards for Installation and Safety

Discover the essential cable tray spacing requirements for safe and efficient installation. Learn key standards, horizontal and vertical spacing, and more.

Requirements for installing fireproof partitions on cable trays

A generic guideline developed by the Cable Tray Institute indicates that cable trays should not be filled in excess of 40-50% of the inside area of the tray or of the tray"s maximum weight based on the
