Surface Drilling Optical Cable

Overview

This guide explains step-by-step procedures, required equipment, safety controls, testing, and pros/cons for installing optical fiber cable using Horizontal Directional Drilling (HDD) and direct-buried systems. Underground cables are pulled in conduit that is buried underground, usually 1-1. 2 meters (3-4 feet) deep to reduce the likelihood of accidentally being dug up. Project success depends on careful planning, precise installation practices, and proper. The following items are key considerations in preparation for installing the fiber optic cable when the construction is ready for cable placement. Optical fiber cable should be carefully inspected when received and stored safely onside during storage before installation. All cables should be tested. While traditional trenching has been used for decades, Horizontal Directional Drilling (HDD)—also called directional drilling—is now the preferred solution for many fiber optic projects. The broad guidelines as laid down by TEC India, for laying of OFC networks are to be followed.
