

Two sets of cable trays connected to one cable tray

Overview

Learn how to connect multiple sections of wire mesh baskets or cable trays efficiently. Tips, tools, and techniques from cable management experts at CMW.

Key Takeaways

Two sets of cable trays can be connected to a single cable tray using couplers, bolts, or proprietary splice kits to ensure structural integrity, alignment, and safe cable support. Connection Methods1. Couplers and Bolts Sections of cable trays are commonly joined using couplers or bolt sets, which provide a rigid and secure connection.

Bolt sets are ideal for heavier cable loads or larger bundles, ensuring the trays remain aligned and structurally sound under mechanical stress. 2. Proprietary Connector Kits Many manufacturers offer splice or connector kits designed specifically for their cable trays.

These kits allow for faster installation, often tool-less, and ensure compliance with load ratings and safety standards. 3. Alignment Considerations Before tightening any connectors, it is crucial to align the trays properly.

Misalignment can lead to uneven loads, sagging, or stress on the cables, which may compromise both safety and aesthetics.

Practical Tips

Support Elements: Use wall brackets, suspended supports, or center suspensions to maintain stability when connecting multiple trays. **Fittings:** Consider using T-pieces, cross-overs, or reducers if the connection involves changes in direction or width. **Load Ratings:** Ensure the combined load of the connected trays does not exceed the manufacturer's specified load capacity.

Material and Environment: Choose trays and connectors suitable for the environment, such as galvanized steel for corrosion resistance or aluminum for lightweight applications.

Summary

To connect two sets of cable trays to a single tray, use couplers, bolts, or manufacturer-specific splice kits, ensure proper alignment, and provide adequate support. This approach maintains structural integrity, load capacity, and safe cable routing, while allowing flexibility for complex routing configurations in industrial or data center environments.
