What are the different types of elbows in cable trays

Overview

Horizontal elbows (30 deg, 45 deg, 60 deg, 90 deg): Used for changing tray direction on the same plane; suitable for industrial and commercial cable routing. They include elbows, tees, reducers, risers, crosses, and drops engineered to maintain cable bending radius and system continuity. High-precision fabrication ensures structural strength, seamless cable movement, and consistent mechanical/electrical performance across the entire pathway. These systems have 1-1/8″ wide side rail flanges and 4-hole splice plates. Class 2 Tray Fittings are designed. The Snap Track system was designed and is intended to be used as a UL Classified continuous assembly of straight sections, fittings, and accessories used to form a structural support, for the purpose of supporting, protecting, and securely fastening cables. Straight Cable Tray A Straight Cable Tray is the main pathway for straight cable installations.
